

Selected projects at University of Georgia

Ignacy Misztal and Daniela Lourenco

Recent projects

- Blupf90 software
 - Convergence improvements
 - Case of #phenotypes \ll # animals
 - Multiple categorical traits with large data
 - P-values in GWAS with national data sets
- Applications
 - Implementation in dairy
 - Canalization for disease resistance
- Potential negative effects of genomic selection
 - Parameter estimation with large data
- Improvement of accuracies with sequence data
- Explaining peculiarities of GWAS

WHY GWAS IN UGA / BLUPF90 PROGRAMS

Large research interest in GWAS

Limitations for current methods

- Simple models
- Single trait
- Complicated if not all animals genotyped

Can ssGBLUP be used for GWAS?

Genet. Res., Camb. (2012), 94, pp. 73–83. © Cambridge University Press 2012
doi:10.1017/S0016672312000274

73

Genome-wide association mapping including phenotypes
from relatives without genotypes

H. WANG^{1*}, I. MISZTAL¹, I. AGUILAR², A. LEGARRA³ AND W. M. MUIR⁴

¹Department of Animal and Dairy Science, University of Georgia, Athens, GA 30602-2771, USA

²Instituto Nacional de Investigación Agropecuaria, INIA Las Brujas, 90200 Canelones, Uruguay

³INRA, UR631 Station d'Amélioration Génétique des Animaux (SAGA), BP 52627, 32326 Castanet-Tolosan, France

⁴Department of Animal Science, Purdue University, West Lafayette, IN 47907-1151, USA

(Received 19 September 2011; revised 8 December 2011, and 9 March 2012; accepted 13 March 2012)

Discrepancies in GWAS methods

Chicken weight

Manhattan plots by % variance explained by SNP windows

INCLUDING SEQUENCE DATA IN US HOLSTEINS

4M records for Stature

3M Cows

4.6M Animals in pedigree

27k Genotyped Sires

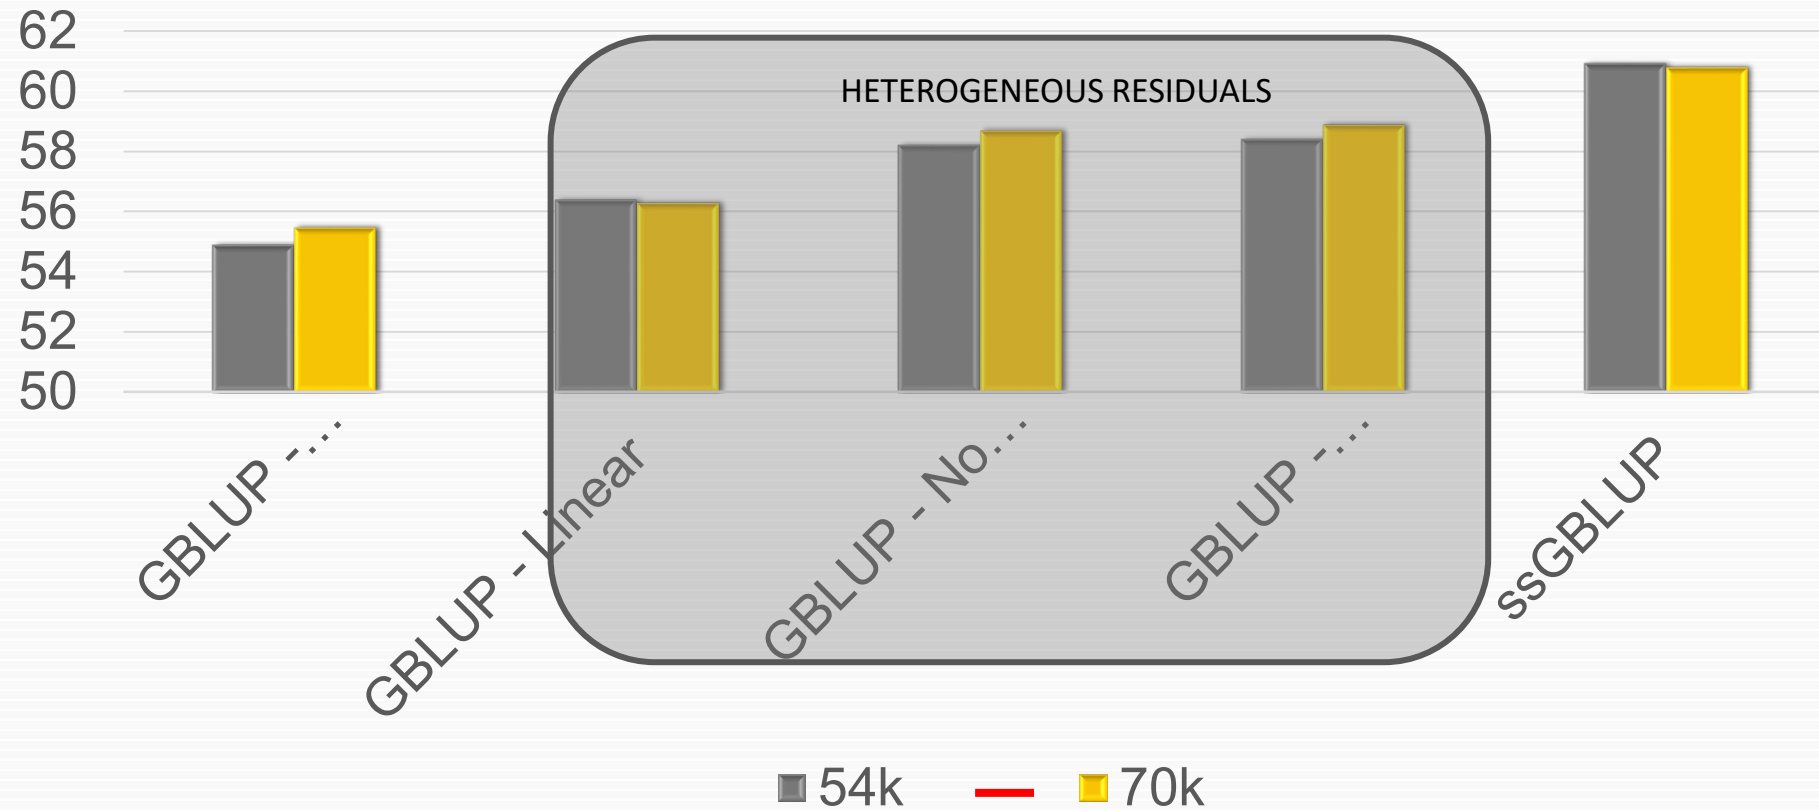

54k SNP

54k SNP + 17k Causative Variants (VanRaden et al., 2017)

Fragomeni et al. (2019)

RELIABILITIES WITH DIFFERENT METHODS AND SNP SETS

P-values for GWAS in (ss)GBLUP

$$pval_i = 2 \left(1 - \Phi \left(\left| \frac{s\hat{n}p_i}{sd(s\hat{n}p_i)} \right| \right) \right) \quad (\text{Chen et al., 2017})$$

If $sd(s\hat{n}p_i)$ approximately constant, Manhattan plots based on $|s\hat{n}p_i|$ and $pval_i$ similar

Large data – PEV from accuracy approximations based on APY algorithm(Bermann et al., 2021)

Post-weaning gain in American Angus

50k genotyped animals

500k genotyped animals

Sequence project at Roslin Institute

- Contracts with major companies (including PIC and COBB)
- Partly gov't supported
- Headed by John Hickey
- 20 students and postdocs

- Steps
 - Imputation to sequence
 - Analyzes

Largest pig sequence data

Total = 379k

Terminal lines

Jang et al. (2023)
Jang et al. (accepted)

Lines	ADG	BF	ADGX	BFX	Animals in pedigree	Sequenced/ Imputed
-------	-----	----	------	-----	------------------------	-----------------------

Sequence Variants

15M to 20M variants

~ 10M segregated across lines

Should we use all 10M?

SNP preselection based on GWAS - I

- Top 40k

Extracting only 40k SNP: Similar number as the regular SNP chip (~40k)

SNP preselection based on GWAS - II

- **Chip+Sign**

Extracting only significant ones + 40k SNP chip

Steps

1) Accuracy of GEBV with SNP preselected from sequence data

- Many animals with sequence

2) Single-line and multi-line ssGBLUP evaluations

3) Compare ssGBLUP with BayesR from Roslin

Ros-Freixedes et al.
Genetics Selection Evolution (2022) 54:65

RESEARCH ARTICLE

Open Access

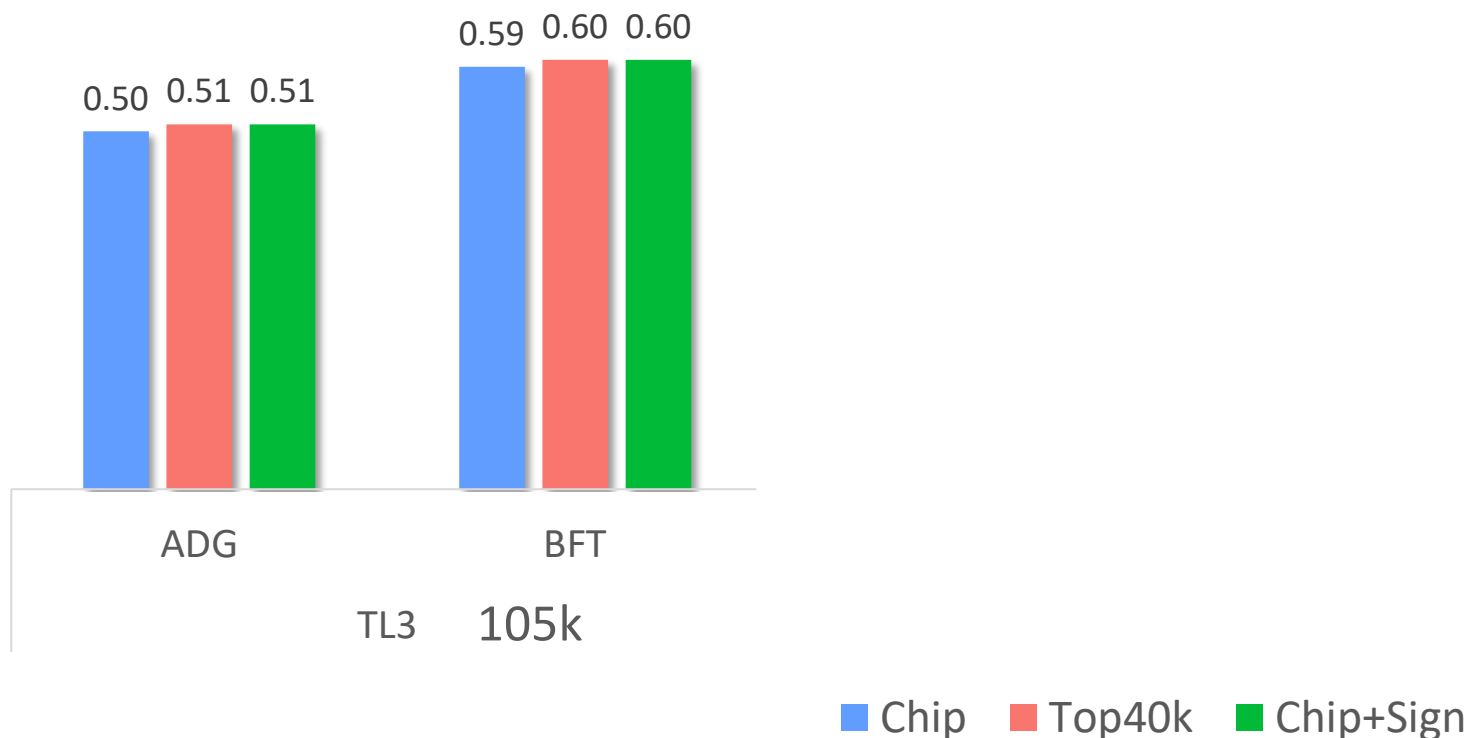

Genomic prediction with whole-genome
sequence data in intensely selected pig lines

Roger Ros-Freixedes^{1,2*}, Martin Johnsson^{1,3}, Andrew Whalen¹, Ching-Yi Chen⁴, Bruno D. Valente⁴,
William O. Herring⁴, Gregor Gorjanc¹ and John M. Hickey¹

Step 1 – Accuracy with preselected variants

- Prediction accuracy = $\text{cor}(\text{DEBV}, \text{GEBV})$

Step 2 – Single vs. Multi-line all traits

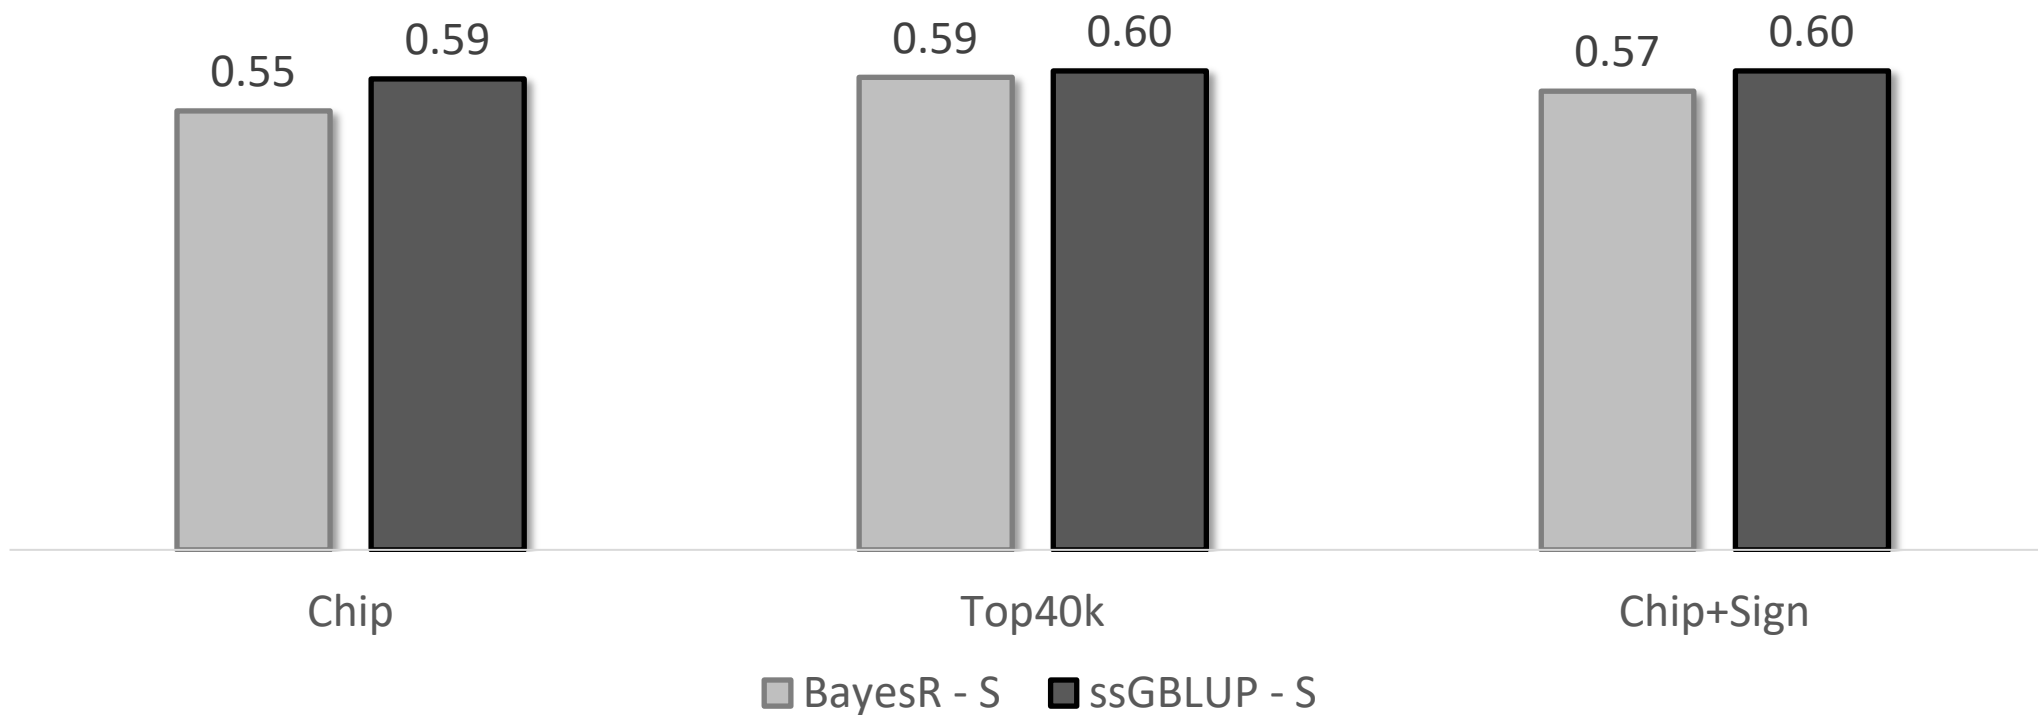

- Prediction accuracy = $\text{cor}(\text{DEBV}, \text{GEBV})$

Multi-line GWAS and predictions dominated by TL3

Predictions must be not QTL oriented!

Step 3 - ssGBLUP vs. BayesR

Questions with GWAS and predictions

- Little or no gain with sequence data for ssGBLUP with commercial data
- GWAS by
 - % of variance explained usually per 1Mb
 - p-values
- Few regions explain $> 1\%$ additive variance
- Lots of QTLs detected with small data sets
- Fewer QTLs detected with large data

First conception rate on 2k Holstein heifers

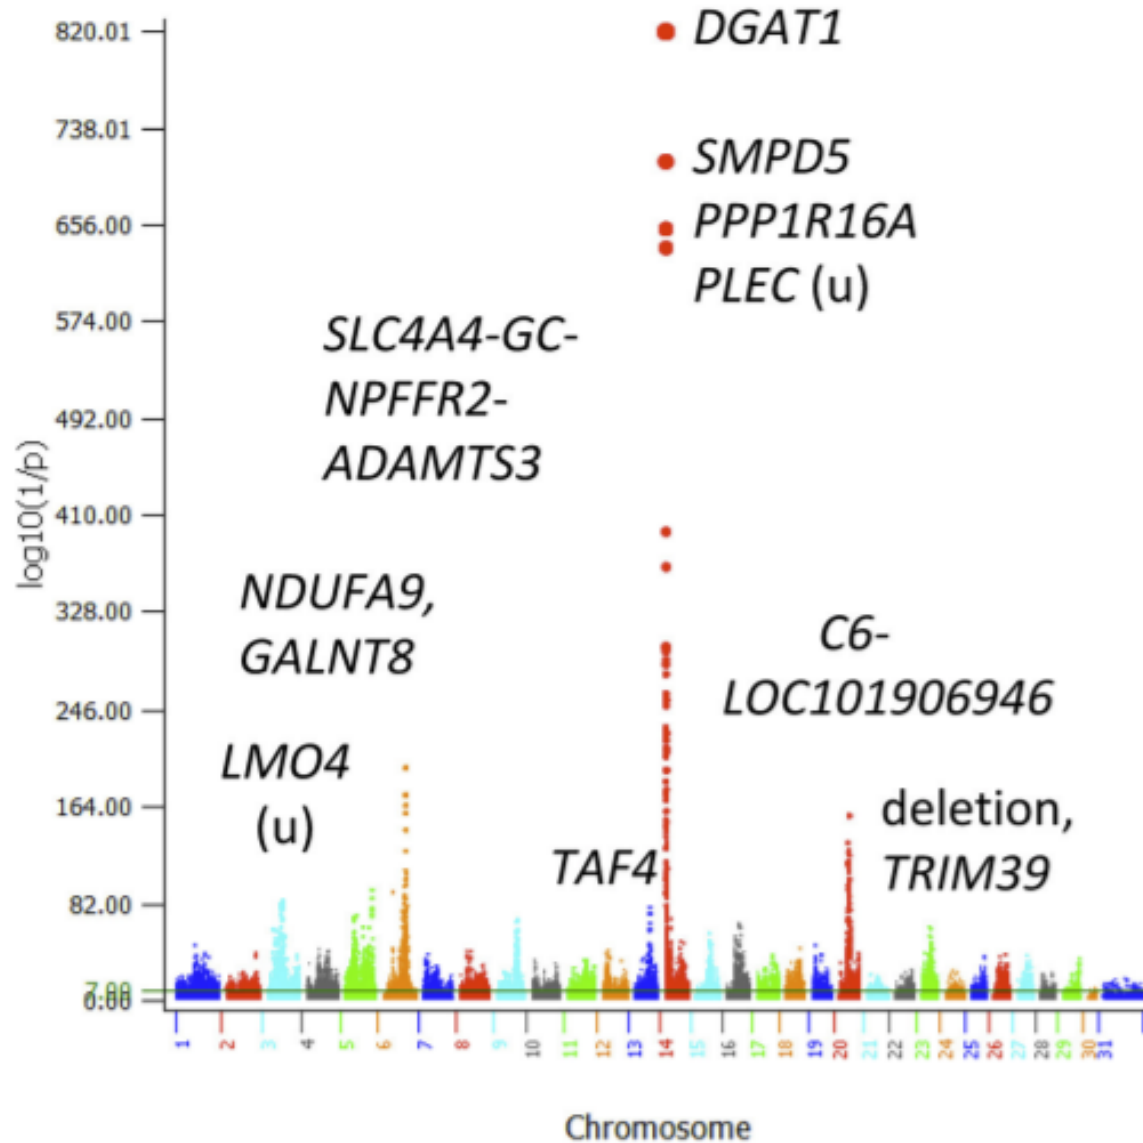

Estimated heritability 36% (normally 1%)

Identified 146 unique loci at $p < 5 \times 10^{-8}$ level

Galliou et al., 2020, <https://doi.org/10.3390/genes11070767>

GWAS on 294k Holstein cows

A Milk yield: additive effect

Jiang et al., 2019

doi: 10.3389/fgene.2019.00412

Manhattan plots for simulated population with 100 identical equidistant QTNs

Expectation

Based on SNP values

Based on p-values

Plots averaged for 100 QTN

Pairwise linkage disequilibrium curve

~ 2 Mb for cattle
~ 5 Mb for pigs/chickens
~ 15 kb for humans

$1/N_e$ Morgans for 80% QTN variance
 N_e - effective population size

What is Manhattan plot composed of?

QTNs

**Bigger with larger QTN
and larger data**

Relationships

Noise

Smaller with more data

Combined

Why ssGBLUP accounts for QTN?

SNPs cover QTN LD curve

Effective population size affects GWAS

Sungbong et al., 2021

Distribution of QTL effects

GWAS using 35k Holstein bulls

Milk – first parity

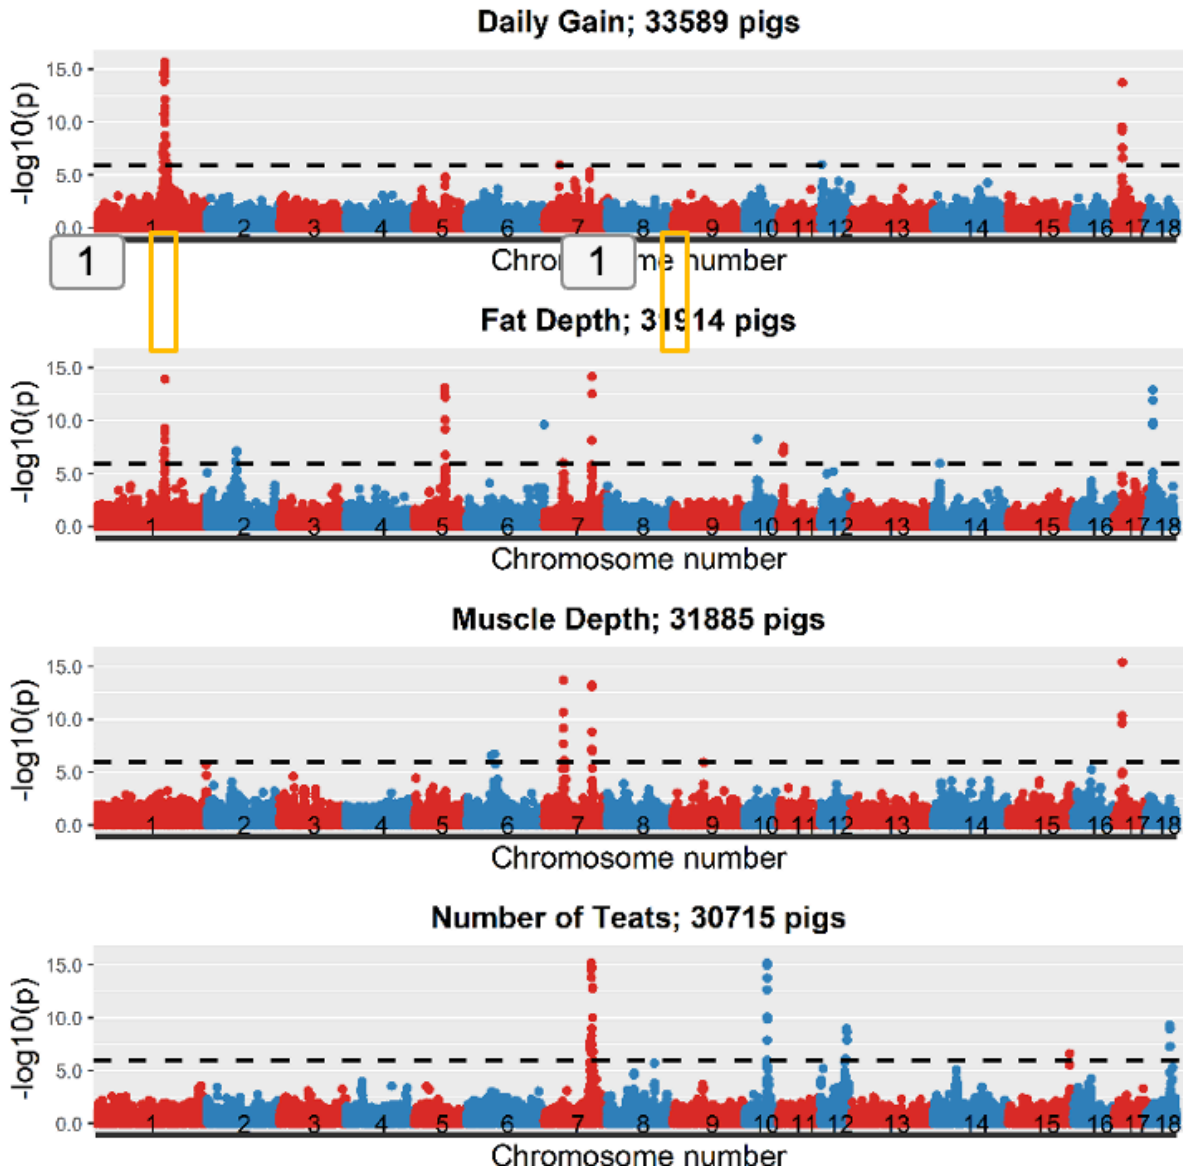

Mortality – first parity

(Tokuhisa et al, 2014;
Tsuruta et al., 2014)

GWAS for various traits and index in pigs

Bijma, EAAP 23

Index

- Different peaks in different lines
- Antagonistic pleiotropy

Conclusions for GWAS

- QTN profile wide with small effective population size
- Large signals in GWAS due to QTN, relationships and noise (incl. Imputation)
 - If no LD curve, probably false signal
- Large QTL show pleiotropy – QTL not visible in index
- ssGBLUP accounts for QTL with large data

Possibly Negative Impact of Genomic Selection

Ignacy Misztal and Daniela Lourenco

University of Georgia

Negative effects of genomic selection

- Informal industry reports:
 - Deteriorating sow survival and pig mortality in pigs
 - Deteriorating feet & legs in beef
 - Short teats and increased calf mortality in dairy
 - Increased sensitivity to heat stress in dairy
 - Deteriorating disease resistance across species

Genetic selection as optimization

- Selection for one trait or an index
- Gains on selected traits
- Losses on correlated antagonistic traits
- Losses compensated by improved environment/management

History of selection strategies

- Domestication
- Unformal
- Large-scale single-trait for production traits
- Multi-trait with fitness traits
- Genomic

Example of effects of mostly single-trait selection

Side effects of intensive selection for growth in broiler chicken

- Unlimited appetite / obesity → artificial lighting
- Poor survival of males → male supplementation
- Increased susceptibility to diseases → antibiotics
- Low hatchability → alternate heating/cooling of incubators
- ...

All companies – similar problems at same time

Initially problems kept confidential

Undesirable side effects of selection for high production efficiency in farm animals: a review

Received 4 July 1997; accepted 29 April 1998

...over 100 references on undesirable(cor)related effects of selection ... in broilers, pigs and dairy cattle....

Future application ... DNA-techniquesmore dramatic consequences....

Selection for more than production traits alone may prevent such.

Hypothetical trend changes in 3 stages of genetic selection

Trends for daughter pregnancy rate

Changes in (co)variances in pigs due to genomic selection

Heritability for growth

Genetic correlation with reproduction

Hidalgo et al. (2019)

Heritability halved, antagonistic correlations $-0.3 \rightarrow -0.5$

Why changes in genetic parameters?

- Bulmer effect
- Changing resource allocation

- Changes in gene frequencies
- Changes in trait definitions
- G x E
- Recessives
- ...

How to circumvent negative effects?

- Start or expand recording for problematic traits
- Update selection index
 - Needs estimates for last generation
- Focus on traits where the parameters are changing rapidly
 - Needs estimates generation by generation

Possible changes in heritability

Possible changes in genetic correlations

Using theoretical and realized accuracies to estimate changes in heritabilities and genetic correlations

Ignacy Misztal

University of Georgia

Realized and theoretical accuracies

Realized accuracy $acc = corr(y - Xb, \hat{u})/h$

Legarra et al. (2008)

$y - Xb$ - adjusted phenotype

\hat{u} - breeding value obtained without
that phenotype

h^2 - heritability

Theoretical accuracy $acc = \sqrt{\frac{Nh^2}{Nh^2 + M_e}}$

Daetwyler et al. (2008)

N – number of genotyped animals with phenotypes
 M_e – number of independent chromosome segments

$M_e \approx 5k$ (chickens, pigs), $10k$ (beef), $15k$ (Holsteins)
Pocrnic et al. (2017)

Heritability by predictivity

$$\widehat{h^2} = \frac{c^2 + \sqrt{c^4 + 4c^2 M_e / N}}{2}, c = \text{corr}(y - Xb, \hat{u})$$

c - predictivity

M_e – number of independent chromosome segments (about 10k in beef)

N – number of reference animals with phenotypes and genotypes

$$SE(\widehat{h^2}) \approx \frac{1}{\sqrt{N_{val}}} \left[c + \frac{2c^2 + \frac{4M_e}{N}}{\sqrt{c^2 + \frac{4M_e}{N}}} \widehat{h^2} \right] \approx \frac{3c}{\sqrt{N_{val}}}$$

N_{val} – number of animals in validation

Heritability for milk in Holsteins

J. Dairy Sci. 104:5843–5853

Genomic predictions for yield traits in US Holsteins with unknown parent groups

A. Cesarani,^{1*}  Y. Masuda,¹  S. Tsuruta,¹  E. L. Nicolazzi,² P. M. VanRaden,³  D. Lourenco,¹ 
and I. Misztal¹ 

¹Department of Animal and Dairy Science, University of Georgia, Athens 30602

²Council on Dairy Cattle Breeding, Bowie, MD 20716

³Animal Genomics and Improvement Laboratory, Agricultural Research Service, USDA, Beltsville, MD 20705-2350

# animals with phenotypes and genotypes	580k
# animals with validation	381k
Assumed # chromosome segments M_e	15k
Predictivity	0.55
Initial h^2	0.35
Calculated h^2	0.33

How to estimate genetic correlations?

Predictivity for trait i

$$\text{corr}(y_i - Xb_i, \hat{u}_i) = \text{acc}_i h_i$$

What is predictivity from trait i to trait j?

$$\text{corr}(y_i - Xb_i, \hat{u}_j) = ?$$

.....
.....

$$\text{corr}(y_i - Xb_i, \hat{u}_j) = \text{acc}_j \text{corr}_{ij} h_i$$

$$\text{corr}_{ij} = \frac{\text{corr}(y_i - Xb_i, \hat{u}_j)}{h_i \text{acc}_j}$$

$$SD(\text{corr}_{ij}) \approx \frac{1}{h_i \text{acc}_j \sqrt{N_{val}}}$$

Conclusions

- Response to QTL wide for pigs & chickens— several Mb
 - Probably false QTL if no LD trail
 - ssGBLUP accounts for QTL with large data
- “Good” large QTLs probably fixed, remaining show pleiotropy
- Potential negative effects of genomic selection on fitness traits
 - faster correlated responses
 - Potentially increased antagonism
- Need new methods to estimate genetic parameters – use of predictivity promising
